

ASSP For Power Management Applications (Secondary battery)

DC/DC Converter IC for Charging

MB3832A

■ DESCRIPTION

The MB3832A is a pulse width modulation (PWM) DC/DC converter IC, incorporating a current detector amplifier and error amplifiers (2 circuits) to control the output voltage and current independently. It is suitable for down-conversion.

With an on-chip reference voltage generator, the MB3832A is best suited for use in applications such as lithium-ion battery (1-cell to 3-cell) chargers.

■ FEATURES

- High precision reference voltage source: $2.5\text{ V} \pm 0.5\%$ ($+25^{\circ}\text{C}$)
: $2.5\text{ V} \pm 1.0\%$ (-10°C to $+85^{\circ}\text{C}$)
- High frequency operating capability: 500 kHz Max.
- Wide operating supply voltage range: 3.6 V to 18 V
- On-chip current detector amplifier with wide in-phase input voltage range: 0 V to V_{CC}
- On-chip standby function
- On-chip triangular waveform oscillator capable of operating in external synchronization
- On-chip, timer-latch short-circuit protection circuit
- Internal totem-pole output stage supporting P-channel MOS FETs and PNP transistors

■ PACKAGE

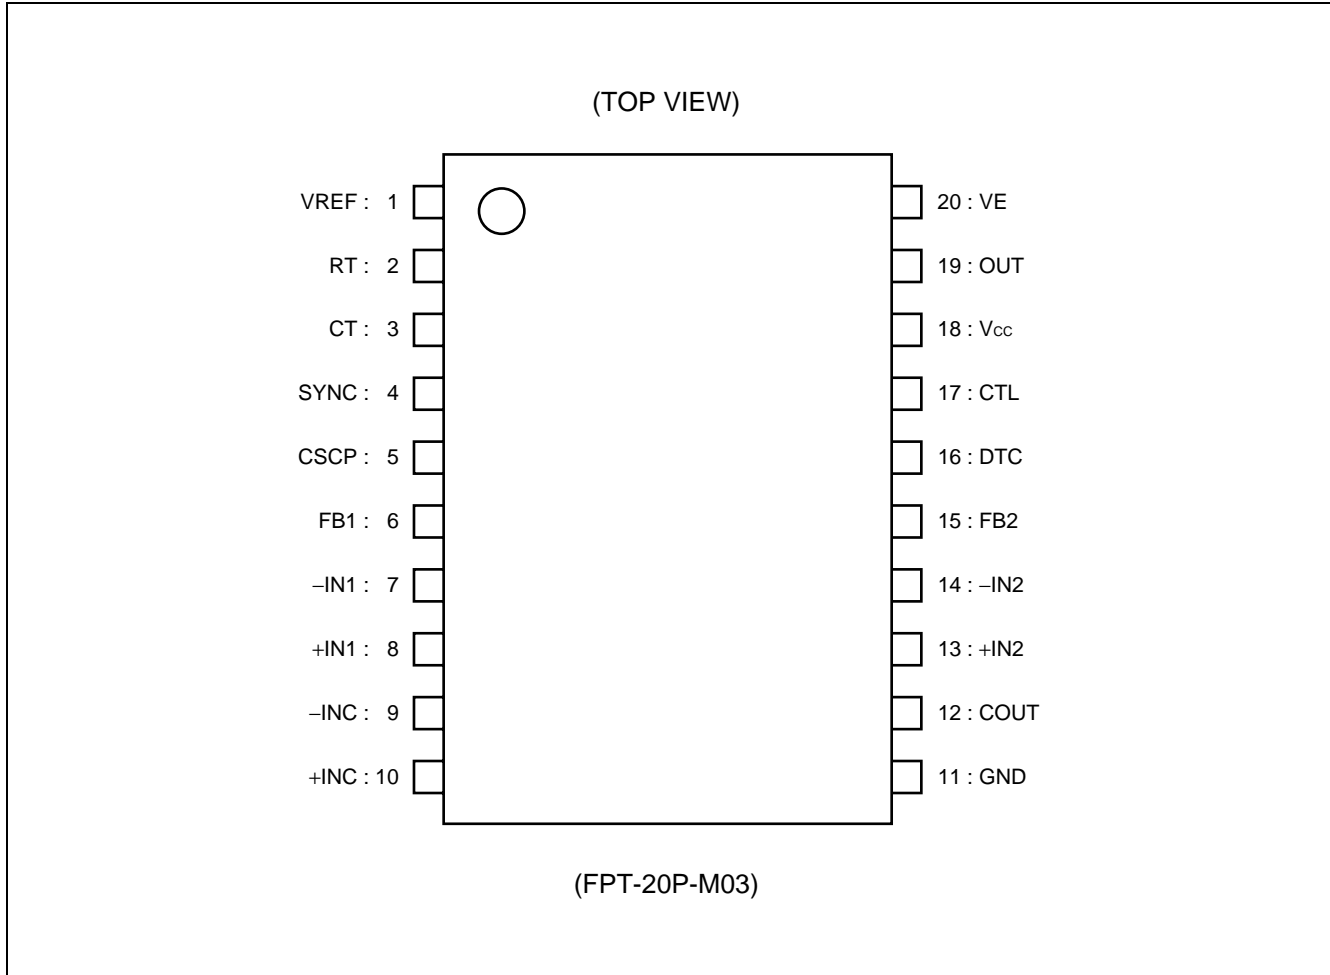

20-pin plastic SSOP

(FPT-20P-M03)

MB3832A

■ PIN ASSIGNMENT

■ PIN DESCRIPTION

Pin no.	Pin name	I/O	Descriptions
1	VREF	O	Reference voltage output terminal
2	RT	—	Connection terminal for triangular wave frequency setting resistor
3	CT	—	Connection terminal for triangular wave frequency setting capacitor
4	SYNC	I	External synchronous signal input terminal
5	CSCP	—	Connection terminal for time constant setting capacitor for timer-latch short-circuit protection circuit
6	FBI	O	Error amplifier 1 output terminal
7	-IN1	I	Error amplifier 1 inverted input terminal
8	+IN1	I	Error amplifier 1 non-inverted input terminal
9	-INC	I	Current detector amplifier inverted input terminal
10	+INC	I	Current detector amplifier non-inverted input terminal
11	GND	—	Ground terminal
12	COUT	O	Current detector amplifier output terminal
13	+IN2	I	Error amplifier 2 non-inverted input terminal
14	-IN2	I	Error amplifier 2 inverted input terminal
15	FB2	O	Error amplifier 2 output terminal
16	DTC	I	Connection terminal for dead time/soft start time setting resistor/capacitor
17	CTL	I	Power supply control input terminal “H” level: Active state “L” level: Standby state
18	V _{CC}	—	Power supply terminal
19	OUT	O	Totem-pole output terminal
20	VE	—	Connector terminal for output sink current setting resistor

I: Input pin, O: Output pin

MB3832A

■ BLOCK DIAGRAM

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Condition	Rating		Unit
			Min.	Max.	
Power supply voltage	V _{CC}	—	—	20	V
Control input voltage	V _{CTL}	—	—	20	V
Output current	I _O	OUT terminal, DC	—	50	mA
Peak output current	I _O	OUT terminal, Duty ≤ 5%	—	600	mA
Allowable dissipation	P _D	T _a ≤ +25°C	—	540*	mW
Storage temperature	T _{stg}	—	-55	+125	°C

*: When mounted on a 10 cm-square dual-sided epoxy base board

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Condition	Value			Unit
			Min.	Typ.	Max.	
Power supply voltage	V _{CC}	—	3.6	16	18	V
Reference voltage output current	I _{OR}	—	-1	—	0	mA
Input voltage	V _{IN}	+IN1, -IN1, +IN2, -IN2 terminal	0	—	V _{CC} - 0.9	V
		+INC, -INC terminal	0	—	V _{CC}	V
Control input voltage	V _{CTL}	CTL terminal	0	—	18	V
SYNC input voltage	V _{SYNC}	SYNC terminal	0	—	V _{CC}	V
Output current	I _O	OUT terminal, DC	—	—	30	mA
Oscillator frequency	f _{OSC}	—	10	200	500	kHz
Timing capacitance	C _T	—	100	390	2200	pF
Timing resistance	R _T	—	8.2	12	51	kΩ
Short detection capacitance	C _{SCP}	—	—	0.1	1.0	μF
Operating temperature	T _a	—	-30	+25	+85	°C

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

■ FUNCTIONAL DESCRIPTION

1. Switching Regulator Functions

(1) Reference voltage circuit (Ref)

The reference voltage generator uses the voltage supplied from the V_{CC} terminal (pin 18) to generate a temperature-compensated, stable voltage (about 2.50 V) as the reference supply voltage for the IC's internal circuitry.

The reference voltage can be output, up to 1 mA, to an external device through the VREF terminal (pin 1).

(2) Triangular wave oscillator (OSC)

The triangular wave oscillator generates a triangular waveform with a timing capacitor and a timing resistor respectively connected to the CT terminal (pin 3) and RT terminal (pin 2).

The triangular wave is input to the PWM comparator in the IC while it can also be supplied to an external device through the CT terminal. In addition, the oscillator can be used for external synchronization, where it generates a triangular wave synchronous to the input signal from the SYNC terminal (pin 4).

(3) Error amplifiers (Error Amp. 1, 2)

The error amplifiers detect the output voltage from the switching regulator and outputs the PWM control signal. It supports a wide range of in-phase inputs from 0 V to " $V_{CC} - 0.9$ V". An arbitrary loop gain can be set by connecting a feedback resistor and capacitor from the FB1 terminal (pin 6) [FB2 terminal (pin 15)] to the $-IN1$ terminal (pin 7) [$-IN2$ terminal (pin 14)] of the error amplifier, enabling stable phase compensation to the system.

(4) Current detector amplifier (Current Amp.)

The current detector amplifier provides $25 \times$ amplification of the voltage drop between the two ends of the output sensor resistor (R_S) in the switching regulator, that occurs due to the flow of the charging current. At the same time, the amplifier converts the voltage to the GND-reference voltage level and outputs it to the COUT terminal (pin 12). It can also control the charging current in combination with the error amplifier circuit.

(5) Power control circuit (CTL)

The power control circuit can control turning on and off the power supply through the CTL terminal (pin 17). (Supply current in standby mode: About 0 μ A)

Depending on the voltage level of the PWM Comp. input terminal, the OUT terminal (pin 19) may become "L" level during discharging of the V_{REF} voltage after the CTL terminal is turned off with a capacitor connected to the V_{REF} terminal. The power control circuit contains a function for fixing the OUT output terminal to the "H" level when CTL = "L" and V_{REF} = "H", preventing inadvertent "L" level output after turning the CTL terminal off.

(6) PWM comparator circuit (PWM Comp.)

The PWM comparator circuit is a voltage-pulse width converter for controlling the output duty of the error amplifiers (Error Amp. 1, 2) depending on their output voltage.

The PWM comparator circuit turns on the external output transistor during the interval in which the triangular wave voltage level is lower than the voltage level at both of the error amplifier output terminals (FB1 terminal (pin 6), FB2 terminal (pin 15)) and the DTC terminal (pin 16).

(7) Output circuit (Out)

The output circuit uses a totem-pole configuration, capable of driving an external P-channel MOS FET and PNP transistor. It can also control the output sink current with a resistor connected between the VE terminal (pin 20) and the GND terminal (pin 11).

2. Protection Functions

(1) Low input voltage malfunction preventive circuit (ULVO)

The transient state or a momentary decrease in supply voltage, which occurs when the power supply is turned on, may cause errors in the control IC, resulting in breakdown or degradation of the system. The low input voltage malfunction preventive circuit detects the internal reference voltage level according to the supply voltage and turn off the external output transistor to make dead time 100%. The circuit restores voltage supply when the supply voltage reaches its threshold voltage.

(2) Timer-latch short-circuit protection circuit (SCP Comp., SR Latch)

The latch circuit detects the output voltage levels of the error amplifiers. When the output voltage levels of the two error amplifiers reach about 2.1 V at the same time, the timer circuit is actuated to start charging the external capacitor connected to the CSCP terminal (pin 5). If the error amplifier outputs are not restored to the normal voltage range before the capacitor voltage reaches about 0.7 V, the latch circuit is actuated to fix the output terminals (OUT) at the "H" level. To reset the actuated protection circuit, turn the power supply on back.

METHOD OF SETTING FOR EXTERNAL SYNCHRONOUS OSCILLATION

For external synchronous oscillation, connect a timing capacitor (C_T), a timing resistor (R_T), and an external sync signal to the C_T , R_T , and SYNC terminals, respectively.

In this case, select the C_T and R_T so that the oscillation frequency is 5% to 10% lower than the frequency of the external synchronous signal excluding the setting error of the oscillation frequency.

The duty cycle (t_1/t) of the external sync signal must be set within a range from 10% to 90%.

<Triangular wave oscillator (OSC) equivalent circuit>

<Free-run oscillation>

<External synchronous oscillation>

*: $| = V_{RT}/R_T$, V_{RT} (pin voltage at pin 2) = 1.0 V (typical)

■ TREATMENT OF UNUSED CSCP PIN

When the timer-latch short-circuit protection circuit is not used, connect the CSCP terminal (pin 5) to the GND at the shortest distance.

Treatment of the CSCP terminal when not used

■ OSCILLATOR FREQUENCY SETTING

The oscillator frequency can be set by connecting a timing capacitor (C_T) to the CT terminal (pin 3) and a timing resistor (R_T) to the RT terminal (pin 2).

Oscillator frequency: f_{osc}

$$f_{osc} \text{ (kHz)} \doteq \frac{936000}{C_T(\text{pF}) \cdot R_T(\text{k}\Omega)}$$

■ METHODS OF SETTING THE DEAD TIME

When the device is set for step-up inverted output based on the flyback method, the output transistor is fixed to a full-ON state (ON duty = 100%) when the power supply is turned on. To prevent this problem, you may determine the voltage at the DTC terminal (pin 16) from the V_{REF} voltage so you can set the output transistor's dead time (maximum ON-duty period) as shown in Figure a below.

When the voltage at the DTC terminal (pin 16) is higher than the triangular wave output voltage from the oscillator, the output transistor is turned off. The dead time calculation formula assuming that triangular wave amplitude \approx 0.6 V and triangular wave minimum voltage \approx 1.3 V is given below.

$$\text{Duty (ON)} \approx \frac{V_{dt} - 1.3 \text{ V}}{0.6 \text{ V}} \times 100 [\%], \quad V_{dt} = \frac{R_2}{R_1 + R_2} \times V_{REF}$$

When the DTC terminal is not used, connect it directly to the V_{REF} terminal.

• **Figure a Setting the dead time**

• **Figure b Not setting the dead time**

■ METHODS OF SETTING THE SOFT START TIME

To prevent surge currents when the IC is turned on, you can set a soft start using the DTC terminal (pin 16).

When power is switched on, the current begins charging the capacitor (Cdt) connected the DTC terminal. The soft start process operates by comparing the soft start setting voltage, which is proportional to the DTC terminal voltage, with the triangular waveform, and varying the ON-duty of the OUT terminal (pin 19).

The soft start time until the ON duty reaches 50 % is determined by the following equation:

For figure c

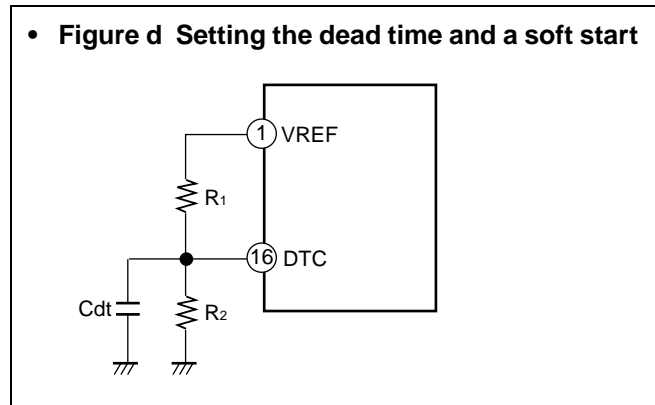

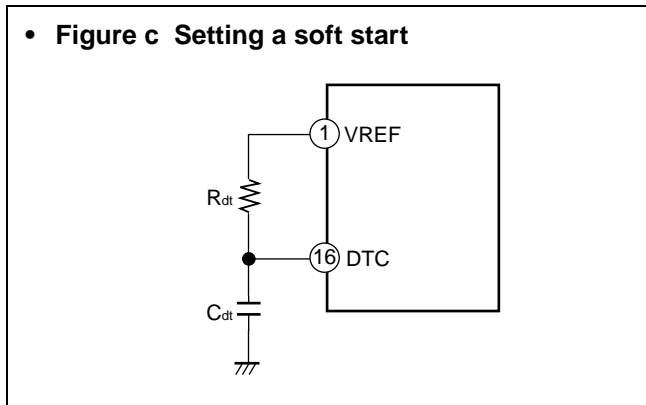

Soft start time (time until output ON duty = 50%)

$$t_s (s) = C_{dt} (F) \times R_{dt} (\Omega) \times \ln(1 - 1.6/2.5) \quad \approx 1.022 \times C_{dt} (F) \times R_{dt} (\Omega)$$

For figure d

Soft start time (time until output ON duty = 50%)

$$t_s (s) = - \frac{C_{dt} (F) \times R_1 (\Omega) \times R_2 (\Omega)}{R_1 (\Omega) + R_2 (\Omega)} \times \ln \left(1 - \frac{1.6 (R_1 (\Omega) + R_2 (\Omega))}{2.5 R_2 (\Omega)} \right)$$

■ USAGE PRECAUTIONS

1. Printed circuit board ground lines should be set up with consideration for common impedance.
2. Take appropriate static electricity measures.
 - Containers for semiconductor materials should have anti-static protection or be made of conductive material.
 - After mounting, printed circuit boards should be stored and shipped in conductive bags or containers.
 - Work platforms, tools, and instruments should be properly grounded.
 - Working personnel should be grounded with resistance of 250 k Ω to 1 M Ω between body and ground.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
